USCGC HAMILTON (WHEC 715)

ABSTRACT

Oceanographic data from ten cruises on Ocean Station CHARLIE (52°45′N, 35°30′W) during the period April 1967 to April 1968 are presented. These data consist of observed and interpolated temperature and salinity data from 187 shallow ($\leq$1500 meters) and 7 deep ($>$1500 meters) casts. Temperature-depth and salinity-depth distribution plots show that the temperature distribution follows a seasonal trend, but the salinity distribution is more diverse. Temperature-salinity plots for the deep casts indicate the presence of Labrador Sea Water and Northeast Atlantic Deep Water. The thermohaline characteristics of the –20 salinity anomaly (Bubnov, 1967) indicate water of Subarctic Intermediate Water characteristics at Ocean Station CHARLIE. Examination of the sea surface temperature and salinity shows that Subarctic Intermediate Water was formed in the area of Ocean Station CHARLIE from January to April 1968 but not from June to November 1967.

OCEANOGRAPHIC OBSERVATIONS NORTH ATLANTIC OCEAN STATION CHARLIE 52°45′N, 35°30′W April 1967–April 1968

by

Lawrence J. Hannon[1]

INTRODUCTION

Ocean Station CHARLIE is one of several ocean stations in the North Atlantic Ocean at which U.S. Coast Guard cutters regularly collect meteorological and oceanographical data. This report is the third United States Coast Guard Oceanographic Report (CG 373 Series) on Ocean Station CHARLIE. The two previous reports cover the periods June 1964 to January 1965 (Husby, 1966) and May 1966 to March 1967 (Husby, 1968).

DATA ACQUISITION AND PROCESSING

This report contains time series oceanographic data that were collected by the U.S. Coast Guard ocean station vessels at Ocean Station CHARLIE (52°45′N, 35°30′W) during the period April 1967 to April 1968 (Table 1).

Ocean station vessels normally maintain position within a ten mile square grid centered on the nominal station, operations and weather permitting. Actual positions of the stations taken during each patrol are presented in figures 1–10. Only those stations taken outside the ten mile square grid have been plotted.

The observational program consisted of daily Nansen casts with sampling depths of 0, 10, 30, 50, 75, 100, 150, 200, 400, 500, 600, 800, 1000, and 1500 meters. For deep casts, sampling depths were 2000, 2500, 3000, and 150 and 50 meters above the bottom as indicated by the vessels' fathometer. In April 1968 the USCGC HAMILTON was one of the first ocean station vessels on an ocean station to use the Bissett-Berman Model 9006–N Salinity/Temperature/Depth Measuring System (STD). The STD casts were taken to a depth of 1500 meters each day at 0000, 0600, 1200, and 1800 GMT, weather and other operations permitting.

Each Nansen bottle was equipped with two protected deep-sea reversing thermometers. In addition five Nansen bottles, used at 200 meters and below, were fitted with an unprotected thermometer to allow determination of thermometric depths. Uncorrected main and auxiliary temperatures were transmitted via radio teletype to the Coast Guard Oceanographic Unit for real-time data processing and quality control.

Corrected temperatures and thermometric depths were computed with a Digital Equipment Corp. PDP–5 computer. After being quality controlled, these data were relayed to Fleet Weather Center, Norfolk, Va., and to Fleet Numerical Weather Central, Monterey, Calif., for use in forecasting synoptic oceanic conditions.

Salinities were determined aboard ship using an inductive salinometer. The conductivity values obtained were converted to salinities using the International Oceanographic Tables published jointly in 1966 by UNESCO and the National Institute of Oceanography of Great Britain. The results were sent to the Coast Guard Oceanographic Unit by radio teletype at intervals of 3–5 days. A second water sample was collected from the top and bottom Nansen bottles; these samples were processed at the Coast Guard Oceanographic Unit as a quality control.

*The C in the cruise number indicates Ocean Station CHARLIE. The number is the occupation number.
**No salinity data.

Data (STD) taken by the HAMILTON were relayed directly to Fleet Weather Center, Norfolk, Va. for use in forecasting synoptic oceanic conditions. In addition, all the data were returned to the Coast Guard Oceanographic Unit for quality control prior to submission to the National Oceanographic Data Center (NODC). The interpolated temperatures and salinities for standard depths, sigma-t values, specific volume anomalies, and sound velocities were computed by NODC and are presented in Appendix A.

Analysis of the oceanographic data was based on the distribution of temperature versus depth (figs. 11–20) and salinity versus depth (figs. 21–29). Temperature-salinity curves for all stations deeper than 1500 meters are shown in figure 30. The method of salinity anomalies from Helland-Hansen and Nansen (1926) was applied to the data for analysis of the presence of Subarctic Intermediate Water.

INTERPRETATION OF RESULTS

Temperature and Salinity Distributions

The maximum temperatures, which ranged from 11.80° C. to 12.20° C., occurred at the surface during August 1967 (fig. 14). The isothermal layer reached its greatest depth of about 200 meters in February and March 1968 (fig. 19) as a result of increased mixing due to wind and low surface temperatures.

The minimum salinities, which ranged from 34.67°/$_{oo}$ to 34.81°/$_{oo}$, occurred near the surface during January 1968 (fig. 28). Although the range of the salinity minimum varied, there was a constant renewal of low salinity water at the surface during the year. (This low salinity intrusion will be discussed under Subarctic Intermediate Water.) The salinity maximum of 35.10°/$_{oo}$ occurred in July 1967 at a depth of about 200 meters (fig. 23).

Labrador Sea Water (LS) and Northeast Atlantic Deep Water (NEAD)

Temperature-salinity plots (potential temperature was used for temperatures below 4° C) were constructed for all seven deep casts at Ocean Station CHARLIE (fig. 30). The points characteristic of the deep water masses in the area of Ocean Station CHARLIE are indicated on the T-S plots. These deep water masses and their acronyms are listed in Table 2 along with the scientists who defined them. Hereafter the acronyms in Table 2 will be used.

The most striking features of these deep T-S relationships are the salinity minimum at about 1000 meters depth and the increasing salinity values below 1000 meters. The salinity minimum is the result of the influence of LS. The increasing salinities below 1000 meters tend toward water of NEAD origin. According to Lee and Ellett (1967), NEAD is Scotland-Iceland overflow from the Norwegian Sea while NWAB is Greenland-Iceland overflow from the Norwegian Sea. They further theorized that NAD was formed by the mixing of NEAD with NWAB. Note that no NWAB or NAD is indicated by the T-S diagrams. It appears that Ocean Station CHAR-

TABLE 2.—Deep water masses of Ocean Station CHARLIE.

Water Mass	Acronyms	Defined By
Labrador Sea Water	LS	Worthington and Metcalf (1961)
North Atlantic Deep Water	NAD	Worthington and Metcalf (1961)
Northeast Atlantic Deep Water	NEAD	Worthington and Metcalf (1961) and by Lee and Ellett (1967)
Northwest Atlantic Bottom Water	NWAB	Lee and Ellett (1967)

LIE is too far southeast to be influenced by NWAB; thus, no NAD is formed.

Subarctic Intermediate Water (SAI)

The method of salinity anomalies from Helland-Hansen and Nansen (1926) was applied to the data collected on Ocean Station CHARLIE, April 1967 to April 1968. This method requires the determination of a T-S curve which is not influenced by the water mass or area to be studied. Using the Sargasso Sea T-S curve (Iselin, 1936) as a standard (fig. 31), observed T-S values from Ocean Station CHARLIE were compared, and the salinity anomalies (differences) were determined.

The results indicated a high negative salinity anomaly in the upper 200 meters at Ocean Station CHARLIE. A negative salinity anomaly value defines a salinity which is less than the salinity of the standard curve at a given temperature. A value of –20, for example, means that the observed value is .200°/$_{oo}$ less than the standard curve at the corresponding temperature.

Bubnov (1967) stated that the –20 salinity anomaly outlined the area of formation of SAI. The mean and the standard deviation of the depth, temperature, salinity, and sigma-t of the –20 salinity anomaly at O.S. CHARLIE (Table 3) for the period, April 1967 to April 1968, and their ranges were compared with the characteristics of SAI (Bubnov, 1968). This comparison between Bubnov's characteristics and O.S. CHARLIE'S characteristics is presented in Table 4 and shows a very good correlation. This close correlation, then, justified the use of the –20 salinity anomaly at O.S. CHARLIE as an indicator of the presence of SAI.

A comparison of the characteristics of SAI found in Table 4 with those of individual cruises in Table 3 would seem to indicate that water characteristic of SAI is present at Ocean Station CHARLIE during the entire year. However, to consider O.S. CHARLIE to be in the area of formation of SAI, the temperatures and salinities at the surface must also be characteristic

TABLE 3.—The mean and standard deviations of the depth, temperature, salinity, and sigma-t of the –20 salinity anomaly on Ocean Station CHARLIE, April 1967 to April 1968.

Date	Number of Stations*	Depth (m)	Temperature (°C)	Salinity (°/$_{oo}$)	Sigma-t
Apr 67	14**	52±29	6.24±.40	34.84±.01	27.42±.04
May–Jun 67	21**	78±44	6.69±1.0	34.86±.05	27.37±.11
Jul–Aug 67	24	63±18	7.86±.50	34.92±.03	27.25±.05
Aug 67	21	78±26	7.53±.66	34.90±.03	27.28±.07
Aug–Sep 67	21	71±09	8.15±.37	34.94±.03	27.22±.04
Oct–Nov 67	11	115±27	6.83±.77	34.87±.04	27.35±.08
Nov 67	2	125±06	7.20±.11	34.88±.00	27.31±.01
Jan 68	16**	115±31	6.62±.33	34.85±.02	27.38±.04
Apr 68	54 STD	129±28	6.20±.13	34.84±.005	27.42±.02

*Not all stations on every cruise had salinity data.

**No –20 salinity anomaly was observed for 7 of 14 stations in April 67, 12 of 21 in May–June 67, and 1 of 16 in January 68.

TABLE 4.—Comparison of Bubnov's characteristics of Subartic Intermediate Water with the characteristics of the –20 salinity anomaly on Ocean Station CHARLIE, April 1967 to April 1968.

	T°C	Salinity (‰)	Sigma-t	Vertical Thickness (m)
Bubnov's Southern Area of Formation	4.5–7.0	34.70–35.00	27.40–27.70	150–200
-20 Salinity	6–8	34.83–34.92	27.25–27.43	100–160

of SAI. The means and standard deviations of the sea surface temperatures and salinities were computed for all cruises on Ocean Station CHARLIE (Table 5). Table 5 and the characteristics of the –20 salinity anomaly (Table 4) show that Ocean Station CHARLIE was in the area of formation of SAI during April 1967 to June 1967 and January 1968 to April 1968.

Bubnov (1968) proposed two areas of formation of SAI. Ocean Station CHARLIE is near Bubnov's southern area of formation (fig. 32). Although he admitted the lack of winter and summer data, Bubnov believed that SAI was formed during the entire year in both the northern and the southern areas. Due to the close proximity and similar climatological conditions in the area of Ocean Station CHARLIE and the southern area of formation, it is unlikely that SAI was formed from July to November 1967 in the southern area. No conclusions can be made for the northern area of formation based on Ocean Station CHARLIE data.

TABLE 5.—The means and standard deviations of the sea surface temperature and salinity on Ocean Station CHARLIE April 1967 to April 1968.

Month	Number of Stations	Sea Surface Temperature (°C)	Sea Surface Salinity (‰)

Codes Utilized

A complete description of the codes utilized in the tabulation of oceanographic station data can be found in National Oceanographic Data Center publication M–2, Processing Physical and Chemical Data from Oceanographic Stations. (Rev. August 1964, supplement issued May 1966.)

To facilitate use of the oceanographic station data listing, entry headings which are not self-explanatory are described below.

Depth to Bottom	Uncorrected sounding in meters.
Max. Depth of Samples	Depth of deepest sample to nearest multiple of one hundred meters.
Wave observations	
DIR.	Rounded to nearest multiple of 10 degrees.
HGT.	Increments of ½ m. Sum of 5 meters plus increments of ½ m if 50 is added to direction.
PER.	If numerals 2 through 9 are entered, periods in seconds is twice the numeric entry or 2X (numeric entry) +1. For other entries see WMO Code 3155.
SEA.	Sea state according to WMO Code 3700.
Weather Code	If preceded by X, weather according to WMO Code 4501. If a two-digit entry, weather according to WMO Code 4677.
Cloud Code	
Type	Cloud type according to WMO Code 0500.
Amount	Cloud amount in eighths. Entry of the numeral 9 indicates cloud amount could not be estimated.
Water	
Color Code	Color according to Forel-Ule scale.
Trans.	Transparency in whole meters as determined by Secchi disc.
Wind	
Dir.	Rounded to nearest multiple of 10 degrees.
Speed	Letter S indicates wind speed in knots.
Barometer	Barometric pressure given in tens, units, and tenths of millibars.
Air Temp. ° C	Air temperature to tenths of a degree Celsius.

Vis. Code	Visibility according to WMO Code 4300.
No. obs. depths	Number of observed levels associated with the station.
Messenger time	Entered in hours and tenths of an hour GMT. For Nansen casts, indicates time of release of messenger applicable to the observational level. For STD casts, indicates the starting time of lowering the sensor.
Card type	OBS designates observed levels. STD indicates the values at this standard level were interpolated by a modified 3-point LaGrange formula.
Depth (m)	Depth to nearest meter. A postscript T indicates depth was obtained thermometrically; Z indicates uncorrected "wire out" depth. Postscript Q indicates value was marked doubtful by originator; P indicates value was considered doubtful by NODC. Postscripts P and Q retain this meaning throughout the following entries.
T ° C	Temperature to hundredths of a degree Celsius.
S °/₀₀	Salinity in parts-per-thousand.
SIGMA-T	Entered to hundredths.
Specific-volume	Multiply entry by 10^{-7} to obtain specific-volume anomaly in cubic centimeters per gram.
$\Sigma\Delta$D Dyn. M$\times 10^3$	Multiply entry by 10^{-3} to obtain anomaly of dynamic depth in dynamic meters referenced to the seasurface.
Sound Velocity	Sound velocity according to Wilson's formula entered to tenths of a meter per second.

TABLE I.—Observed and interpolated oceanographic data from stations taken by USCGC INGHAM, at Ocean Station CHARLIE, 12 April—30 April 1967, prepared from NODC Listing No. 31-886.
